FOREWORD

It is my great pleasure to introduce the fourth edition of the booklet “Women and Men in Cambodia” produced by the National Institute of Statistics (NIS) of the Ministry of Planning. The statistics show the situation of women and men in many different areas of life. By making the situation for women and men more visible, the statistics can contribute to the ongoing development in Cambodia. Gender equality is one of the most important goals in Sustainable Development Goal (SDG) 2015 to 2030.

I want to take the opportunity to thank Statistics Sweden for their technical assistance, SIDA and UN Women for their financial support in the making of this booklet.

H.E Mrs. Hang Lina, Delegation of Royal Government in charge of Director General of NIS ably coordinated the process of this booklet assisted by her staff and cooperated with the participates attended International Training Program on “Gender Statistics” from the National Institute of Statistics (NIS) of the Ministry of Planning, Ministry of Women’s Affair, Parliamentary Institute of Cambodia, National Audit Authority, and Cambodian Women’s Crisis Center. We thank every one of them for actively participates and contributes on producing this booklet.

PREFACE

This is the fourth edition of the booklet “Women and Men in Cambodia” produced by Gender Statistics Working Group led by National Institutes of Statistics (NIS) of Ministry Planning. The booklet provides a brief overview of the situation for women and men in Cambodia and will be used as useful resources on gender statistics which can be utilized by relevant users.

The publication consists of tables and graphs with a short textual analyses and may serve as a source of information to all users of data interested in the conditions for women and men and gender equality in Cambodia. The information in this booklet has primarily been taken from NIS and other governmental agencies’ statistical production. The source is given in conjunction with each table/graph. In most places, the tables and graphs provide

absolute numbers and/or proportions (%) for certain attributes for women and/or men.

I would like to express my appreciation and thanks to the Gender Statistics Working Group of NIS, Ministry of Women's Affairs, Parliamentary Institute of Cambodia, National Audit Authority, and Cambodian Women's Crisis Center who contributed significantly in preparation of this fourth crucial edition of the Women and Men Booklet. My special thanks to Statistics Sweden for their support and technical assistance.

Hang Lina

Delegation of Royal Government

in charge of Director General

National Institute of Statistics

GENDER EQUALITY

Gender equality means that women and men have equal power to shape society and their own lives. This implies the same opportunities, rights and obligations in all spheres of life.

Gender equality is situation that there is no discrimination on the grounds of a person's sex in the allocation of resources or benefits, or in access to services. Gender equality may be measured in term of whether there is equality of opportunity, or equality of results. The UN Convention on the Elimination of all forms of discrimination against women (CEDAW) can be understood as a statement on what the principle of gender equality of opportunity should mean in practice for all aspects of life, and all sectors of the economy.

Gender equality means fair treatment of women and men. To ensure fairness, measures must often be available to compensate for historical and social disadvantages that prevent women and men from otherwise sharing a level playing field.

Equity leads to equality. Measures that address specific disparities that prevent women from having the same status as men will allow both women and men to share equally in the results and benefits of development. One example of such a measure of equity is the provision of leadership training for women, which address the problem of gender inequality in the structures of governance.

INTRODUCTION

In the fifth mandate in 2013, Gender Equality and Women Empowerment remains key top priority of the Royal Government of Cambodia. Rectangular Strategy Phase III (2014–2018) demonstrates precisely of government's commitment in promoting gender equality and women empowerment, considering women as the backbone of economy and society.

Government through the Ministry of Women's Affairs (MoWA) mandates to improve the status of women by focusing on economic empowerment for women, better access to education for women and girls, legal protection for women and girls, improving health for women and girls, women in decision making and gender mainstreaming in government policy and program reforms,

gender and climate change, green growth and disaster management. Institutional strengthening and capacity development toward gender equality is also one of key focusing areas of MoWA Five Year Strategic Plan (2014–2018).

The Royal Government of Cambodia has indicated strong commitment in promoting Gender Equality and Women Empowerment in all spheres of development. To achieve this, it requires concrete actions and collaboration from all relevant government institutions, NGOs, Civil Society and private sectors to ensure inclusiveness for all and there will be no one left behind.

POPULATION

This chapter describes the population including ratio from the first census 1962 and age structure and the population pyramid, population projection trends, percentage of internal and external migration, percentage of never married population by age and total fertility rate. Sex ratio is defined as the number of males per 100 females in a given population.

In the first census 1962, the sex ratio of Cambodia was almost 100. It dipped to 86 in the early 1980s owing to heavy male mortality during the Khmer Rouge period. It has been improving gradually reaching 93 at the 1998 Census and 95 at the 2008 but 94 at the CIPS2013 is only marginally less than what it was in 2008.

The estimate sex ratio of 96 of the Cambodia Socio-Economic Survey (CSES) 2016 the population consisted of 7.9 million women and 7.6 million men as surplus almost 300 thousand women.

However, the sex ratio has changed from 93 percent in the Population Census 1998 to 96 percent in the CSES 2016. Even if it seems to be an increase, there are still more women than men in the Cambodian population. In most of the countries of the world sex ratio ranges from 95 to 105.

1. Population 1962, 1980, 1994, 1996, 1998, 2008, 2013 and 2016

In thousands and sex ratio

Year	Population			Sex ratio
	W	M	T	
1962	2,866	2,863	5,729	99.9
1980	*	*	*	86.1

1994	5,156	4,714	9,870	91.4
1996	5,387	4,953	10,340	92.0
1998	5,926	5,511	11,438	93.0
2008	6,880	6,516	13,396	94.7
2013	7,555	7,122	14,677	94.3

“*“: Not available

Table 2 presents the information on the percentage of population distributed by urban and rural residences in Cambodia. As observed from the results, the percentage of population is strongly more people living in rural (about 4 times) than in urban of both women and men in Cambodia in all the Census 2008, CIPS 2013 and the CSES2016.

2. Population by area 2008, 2013 and 2016

In percent

	2008		2013		2016	
	W	M	W	M	W	M
Urban	20	19	21	21	24	23
Rural	80	81	79	79	76	77
Total	100	100	100	100	100	100

Source: GPCC 2008, CIPS 2013 and CSES 2016 by NIS

The age structure of the population is determined by the same three factors which affect the growth rate of any population, fertility, mortality and migration. To study the age structure of the population we show the percent distribution of the population in different age groups and sex by a population pyramid which roughly summarizes the demographic history of population. The percentage of males and females by five-year age groups are starting with the youngest age

group at the bottom, and increasing with age towards the top of the pyramid. The percentage of males is depicted to the right and the percentage of females to the left side of the center of the pyramid.

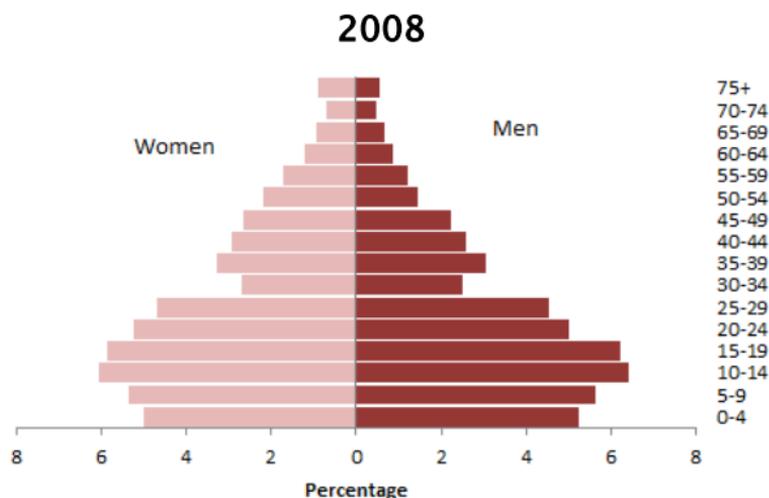

The population pyramid shows that the share of child population (0–14 years) has decreased from 18 percent in 2008 to 16 in 2013 for men and has increased from 13 in 2008 to 14 in 2013 for women.

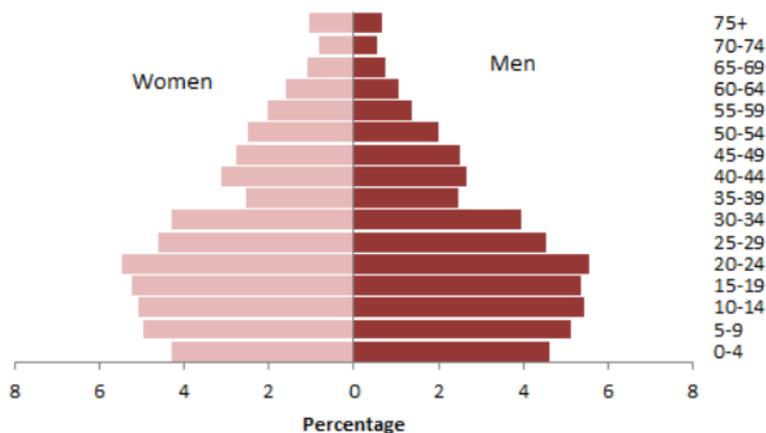

Inversely the percentage of working age population (aged 15–64 years) of Cambodia has increased from 30 percent to 31 percent for male and has increased from 32 percent to 34 percent for female, by almost 2 percent points. The proportion of the elderly population (aged 65 years and over) in the country as a whole has increased from 1.7 percent to 2.0 percent, for men and has

increased from 2.5 percent to 3.0 percent for women.

3. Population by age, 2008 and 2013

Percentage distribution

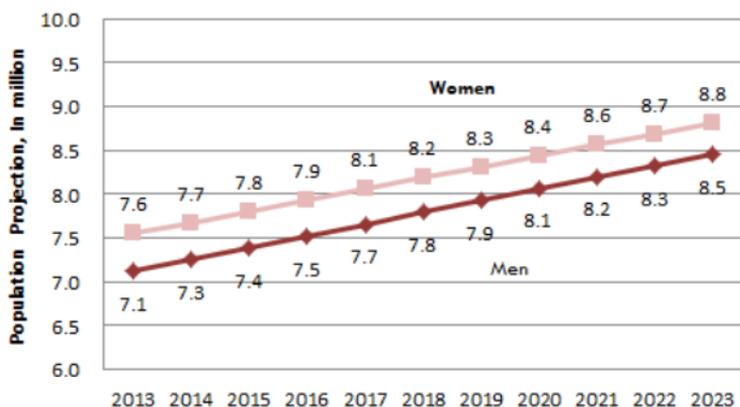

Source: GPCC 2008 and CIPS 2013 by NIS.

The population in Cambodia will increase by about 2.6 million during 2013–2023 according to the population projection for Cambodia. In 2023 it will be 8.81 million of female and 8.46 million of male.

4. Population projection for Cambodia

In million

Source: Population Projection for Cambodia 2008–2050, by NIS.

Among the internal migrants, rural to rural migrants predominate both in 2008 and 2013 with an increased proportion in 2013. The proportions of rural to urban migrants as well as that of urban to urban migrants have each declined by 4 percentage points for women and by 2 percentage points for men during the five years with the former constituting nearly one quarter of all internal migrants and

the latter accounting for almost half of that in 2013.

5. Internal migration by urban and rural areas. 2008 and 2013

In percent and total numbers

Stream of Migration	2008		2013	
	Women	Men	Women	Men
Rural to Rural	49	53	57	60

Urban to Urban	16	14	13	11
Total	100	100	100	100
Total numbers	1,710,000	1,742,000	2,049,000	2,085,000

Source: GPCC 2008 and CIPS 2013 by NIS.

In 2015 and 2016 Thailand had the highest proportion of external migrations and have increased from 79 percent to 92 percent for women and from 73 percent to 88 percent for men. In the next proportion of external migrations steeply falls in Korea and Japan and then Malaysia and Singapore come next in order slightly. Only external migration registered by private companies are included in this table.

6. External migration registered by private companies

Total	100	100	100	100

Source: Annual Report 2016, Ministry of Labor and Vocational training (migration registered by private companies)

Family formation

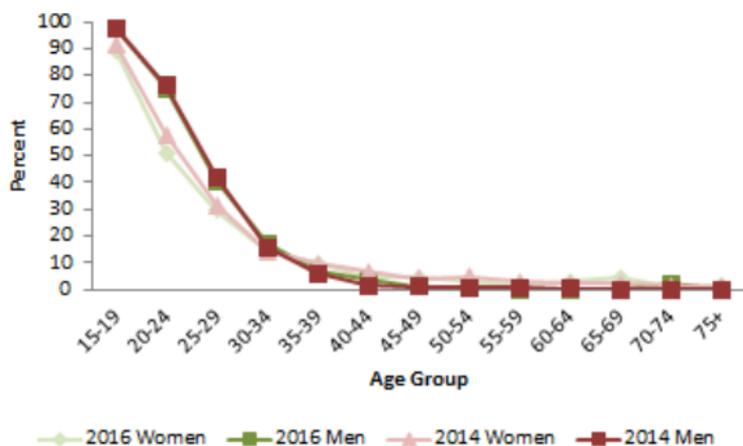

Marital status is a very important factor in population dynamics as it affects fertility and mortality as well as migration to a lesser extent. The table presents the percent distribution of males and females aged 15 years and over by five age groups of never married population. Responses to question on marital status in CSES were grouped into these categories: never married and ever married (currently married, widowed, divorced and separated). A person is considered ever married if by law or local custom and tradition, he or she is acknowledged to be

married, or living with someone of the opposite sex as husband and wife.

It is observed that, the highest proportion, which is about 92 percent of women and 98 percent of men are single in the age group 15–19. By the age 30–34 the proportion of those never married is reduced to about 1percent in both sexes of women and men between 2014 and 2016. Beyond the age of 50 the never married population mostly remained single throughout their life time.

7. Never married population by age, 2014 and 2016

In percentage

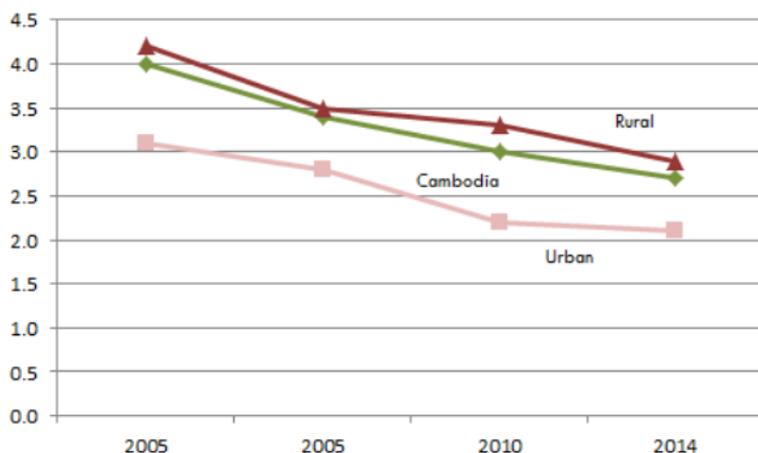

Source: CSES 2014 and CSES 2016 by NIS.

In 2014 the total fertility rate (TFR) in Cambodia was 2.7 children per woman. On average, rural women would give birth to approximately 2.9 children during their reproductive years, while urban women would give birth to only 2.1 children during their reproductive years if they were to follow current levels of fertility throughout their life. The total fertility rate has declined over the past 15 years. The 2000 CDHS and 2005

CDHS each estimated the number of children the average woman would bear in her lifetime to be 4.0 and 3.4 children per women, respectively. By 2010, the TFR further declined to 3.0 children per women.

HEALTH

This chapter presents the main information on life expectancy, contraception knowledge and antenatal care focus on the assistance during deliver, maternal mortality, and the trend of infant mortality rate. These data related to the Four Focusing Priority Policies of National Strategy Development plan 2014 to 2018, which carried out by the Ministry of Health in order to achieve the RGC's priority policy in the fifth legislature and they are also one of the core indicators framework for monitoring and evaluation.

The life expectancy at birth has increased especially for women whose life expectancy has increased with about more than ten years 1998 compared with 2013. The trend women age projections are also expected to reach to

over 76 ages in the next ten years. Women are predicted to live longer than men.

1. Life expectancy at birth. Observed 19XX, 20XX and 20XX and projection 20XX to 2023

Source: Population Projection of Cambodia 2013–2023, NIS.

Current use of contraception method among women in Cambodia continues to increase from the levels reported in the first CDHS in 2000 to 2014. In the last 14 years, women are

more likely to use any modern method; the proportion has increased from 19 percent to 39 percent. In the meantime any traditional method are being used, withdrawal were individual significant used among them. Rhythm was being used similar proportion between years.

2. Distribution of married women age 15–49 currently use of contraception. 2000, 2005, 2010 and 2014

Maternal mortality

There were 32 maternal deaths in the six years between 2008 and 2014. Maternal deaths accounted 9 per cent of all death women, it mean about 1 in 11 Cambodian women who died in that period, which is the annual number of maternal deaths per 1,000 women age 15–49.

4. Maternal mortality 2008–2014, by five year age groups.

Number and percentage of all female deaths

Age	Percentage of female deaths that are maternal	Maternal deaths
15–19	0	0
20–24	13	4
25–29	27	11
30–34	11	5
35–39	16	8
40–44	3	2

45-49	3	2
15-49	9	32

Infant Mortality

The results of the 2014 CDHS with the finding from 2000, 2005 and 2010 showed that the data of infant mortality has declined gradually and substantially in the past 14 years 95 deaths per 1,000 live births in year 2000 to 28 per 1,000 in year 2014. In addition this survey reported that, there were female infant are lower mortality rate than male infant during all life before age 5.

5. Infant mortality, 2000, 2005, 2010 and 2014

Deaths per 1000 live birth

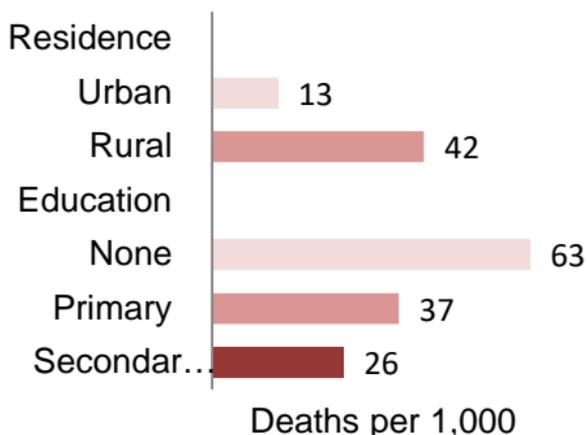

Source: CDHS, 2014

More over the infant mortality rate by socioeconomic characteristics in urban areas was consistently lower than rural areas. In additional, mortality declined markedly as mother's education increases. The children mother who has lowers education or no schooling faced with higher mortality rate, 63 compared to 26 deaths per 1,000 live births for those with secondary education.

6. Infant mortality by socioeconomic characteristics, 2014

Deaths per 1000 live birth

EDUCATION

This chapter provides the literacy by age group, enrolment rate (net and gross enrolment rate) by educational level, dropout rate and reason for drop out school, Educational expenses and percentage by undergraduate/graduated.

Literacy

The adult literacy rate is the share of the population aged 15 years and above who can both read and write a simple message in any language. The literate rate in Cambodia was highest among women and men in the age group 15–24 years in both 2014 and 2016 and then the age group 25–34 years. Generally the literate rate among men was higher than among women in all ages except for the age 6–14 and 15–24 where the literate

rate was higher among women in both years. The literate rate from 6 years and older among women and men 2016 was higher 2014.

1. Literacy by age group, 2014 and 2016

In percent

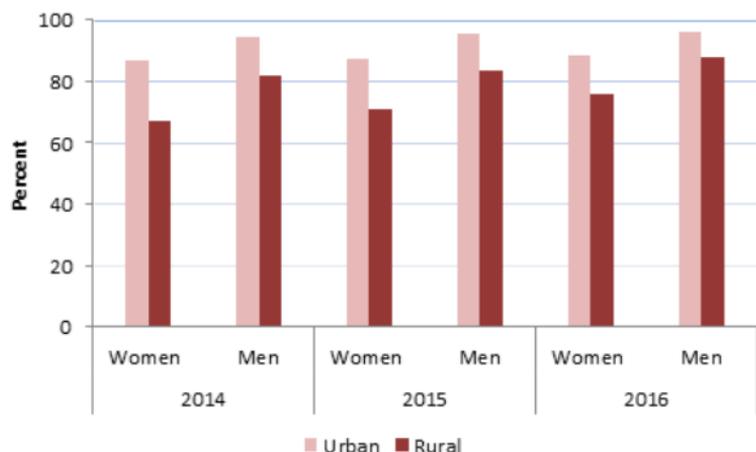

Source: Cambodia Socio-Economic Survey 2014 and 2016 by NIS.

The graph shows that the literate rate among men and among women in urban areas were higher than men and women in rural areas in all years. Adult literacy rate of population

aged 15 and over is lower among women than men in all areas.

2. Literacy (15 years and above) by geographic area, 2014, 2015 and 2016.

In percent

Source: CSES 2014, 2015 and 2016 by NIS.

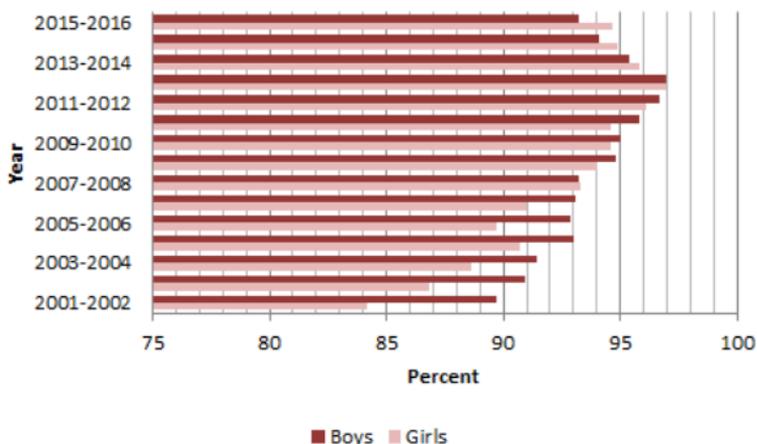

Enrolment rate

Enrolment rate or net enrolment rate (NER) is defined as a percentage of the number of pupils or students in the theoretical age group for a given level of education enrolled

in that level, expressed as a percentage to the total population in that age group. According to the Education Management Information System (EMIS) the percentage was started from 84 among girls, and 90 boys to 97 while increased slightly from 2001–2002 to 2012–2013 but decreased little for both girls and boys in 2013–2014 and decreased slightly in 2015–2016. Enrolment rate 95 percent of boys and 93 percent of girls attending primary education in 2015–2016 and Generally the Enrolment rate of boys was higher than girls in all years except for 2012 to 2016 where the enrolment rate was less different among girls, boys.

3. Enrolment rate in primary education

In percent

Source: Education Statistics & Indicators of Ministry of Education, Youth and Sport

Gross enrolment rate (GER) is defined as a percentage of the number of pupils or students enrolled in a given level of education, regardless of age, expressed to the number of population in the theoretical age group for the same level of education. The table shows that GER at lower secondary education was 55 percent, an increase of 2 percent and 3 percent for girls from 2014 to 2017 in Cambodia and rural areas but a

decreasing 3 percent and 2 percent in urban areas. The corresponding GER have changed only slightly in the last 3 years (2014–2017) for boys.

4. Gross enrollment rate in lower education, 2014 to 2017 In percent

	2014–2015		2015–2016		2016–2017

In table 2.2 we find that people in urban areas had the highest gross enrolment rate in upper secondary school in 2016–2017 for adults aged 15–17 years, which constitutes about 39 percent for women and 38 percent for men. The lower rates are found in rural areas where the gross enrolment among women is about

23 percent and among men about 20 percent. Between the years 2014–2015 and 2016–2017, the gross enrolment rates in upper secondary school were a little higher for women were not change for men in urban and rural areas.

5. Gross enrollment rate in upper education, 2014 to 2017 In percent

Dropout from school

Table 6 shows the percentage of the population aged 6 to 17 years who have dropout from school by educational levels and

sex. As indicated, the percentages of the population who have drop school have decreased in all years. More men than women have drop school in all areas for all years.

6. Dropout rate by educational level. 2013–2016 In percent

The question on reasons for dropout asked only about persons below 18 years who are not attending school. Of this group in 2016 about 43 percent of girls and 35 percent of boys in urban area and about 54 percent of girls and 45 percent of boys in rural area answered that, they wouldn't be able to attend school, because they must work to contribute to household income. Overall, the reason for dropout school is lower in 2016

than in 2014 for girls and boys in all areas except they wouldn't be able to attend school, because of work to contribute to household income and too poor household.

Educational expenses

The amounts incurred as educational expenses during the last school year for each household member attending the formal school system, taking private lessons after

school or following non-formal classes were recorded separately. The total expenses include the following seven categories: school fees, tuition, text books, other school supplies, allowances for children studying away from home, transport cost and gift to teachers, building funds etc.

There are large differences in annual expenses between urban and rural areas among women and men over this period. As the composition of education is different in urban and rural in Cambodia, it follows that the average expenses differ. Urban area has a higher share in levels above primary school and more private schools. The average annual expense for men in the field of education was higher than women's expense in 2015 but the average annual expense for men was lower than women's expense in 2016.

In rural area, the average total cost has increased from 638 thousand riels for women and 677 thousand riels for men in 2015 to 773 thousand riels for women and 737 thousand riels for men in 2016 but in urban area the average total cost has decreased from 1,623 thousand riels to 1,440 thousand riels for men only.

8. Average annual educational expenses by area

Rural	638	677	773	737

Source: CSES 2015 and 2016 by NIS.

There were large differences in educational expenses by education levels. and at higher

levels one which had the highest share of students among women and among men in 2015 and 2016.

In primary school, which had the highest share of students, the cost was about 451 thousand riels for women and 428 thousand riels for men on average in 2015 and about 477 thousand riels for women and 458 thousand riels for men on average in 2016. At the higher levels one find more school fees and tuition expenses which could explain the large differences in cost between different levels in both years.

9. Average annual educational expenses by educational level.

Table shows the percentage by undergraduate/ graduated of students who are attended and attending school by level of education and sex. There was large difference in the level of education among those. The percentage was quite high in pursuing bachelor degree with about 63 percent to 69 percent of women and men and it was then high in graduated with bachelor degree by decreasing 1 percent for women and increasing 1 percent for men between 2014–2015 and 2015–2016.

The pattern was the same for both women and men and the gender difference was small over the period 2014–2016. In 2015–2016, among the students, the share of women and men in all levels are virtually the same, except pursuing master degree. For graduated with bachelor degree and graduated with associate degree levels, the share of students have increased from about one percent and pursuing master degree and graduated with master degree have not been changed in the last year.

VIOLENCE AGAINST WOMEN

Violence against women is not only a women's issue. Domestic and sexual violence, discrimination, human trafficking, and all harmful practices such as early marriage, and gender-based violence are examples of violence against women that can occur within and outside the home. In Cambodia, most cases of intimate partners (usually husbands) are the perpetrators of violence against women, and types of intimate partner violence can include physical, sexual or emotional violence.

This chapter describes the significant findings on violence against women from the Key Gender Statistics 2015 of Ministry Women's Affairs and the Commune Data Base 2014,

2015, 2016. Additional information within this chapter on the relationship between intimate partner violence experience and health are drawn from the 2015 Cambodia Data Sheet on Intimate Partner Violence.

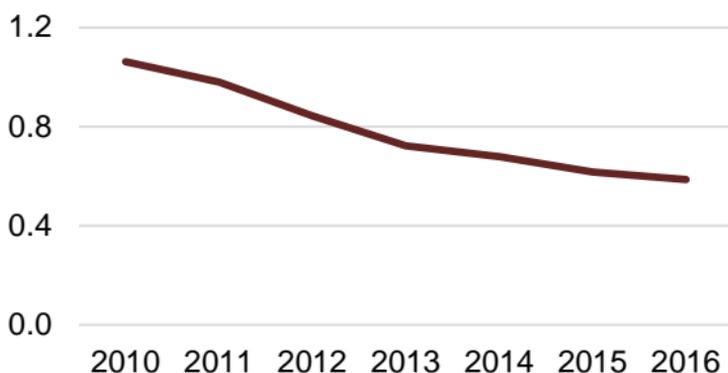

Violence against women: Any act of gender-based violence that results in, or is likely to result in, physical, sexual or psychological harm or suffering to women, including threats of such acts, coercion or arbitrary deprivation of liberty, whether occurring in public or private life.

Intimate partner violence: Any act of violence that cause by a current or former husband/wife or boyfriend/ girlfriend, including cohabitating sexual or non-sexual partners in couple relationships.

The percentage of families having domestic violence has been drop from year to year, as a result it has been drop almost half between 2010 to 2016, from 1 percent to 0.6 percent.

1. Trend of families having domestic violence from 2010–2016

In percent

Source: Commune Data Base, 2014, 2015, 2016

Compared to 2005, the action of domestic violence has been reduced in some actions such as cursing. It has drop from 44 percent

to 31 percent from 2005 to 2009. Pushed/shook/or threw something has been reduce from 18 percent in 2005 to almost 11 percent in 2014, and threatening with a knife reduced from 5 percent to almost 4 percent between 2005 to 2014.

2. The Action That Women Suffer from Domestic Violence between 2005, 2009 and 2014
